Deploy your static website using Github Pages:

Host your local Git repository's static website directly
using Github pages

Name:Hema S Department: ECE

#### Introduction

GitHub Pages is a static site hosting service designed to publish your projects directly from a GitHub repository. It allows developers to showcase their work, create personal websites, or host documentation in an efficient, free, and straightforward way.

#### **Overview**

This project demonstrates how to deploy a static website using GitHub Pages. Starting with the basics of setting up a GitHub repository, we'll explore each step required to host a functional static website. This includes initializing a Git repository, pushing files to GitHub, and configuring GitHub Pages for deployment.

#### **Key Features of GitHub Pages:**

Free hosting for public repositories.

Support for static files (HTML, CSS, JavaScript).

Easy integration with version control through Git.

# **Objectives**

- 1. Learn the fundamentals of GitHub Pages and its deployment process.
- 2. Understand the importance of static website hosting and its use cases.

- 3. Gain hands-on experience in using Git and GitHub for project versioning and hosting.
- 4. Successfully publish a static website and make it publicly accessible.

## **Importance of Hosting with GitHub Pages**

- **1. Cost-effective**: Free for public repositories, making it accessible for students and developers.
- **2. Version Control**: Seamlessly integrates with GitHub, enabling easy updates and collaboration.
- **3. Visibility**: A great way to showcase personal portfolios, projects, or documentation.
- **4. Ease of Use**: Minimal setup required compared to other hosting platforms.
- **5. Custom Domains**: Option to configure custom domains, enhancing the professional appeal of your website.

## **Step-by-Step Overview**

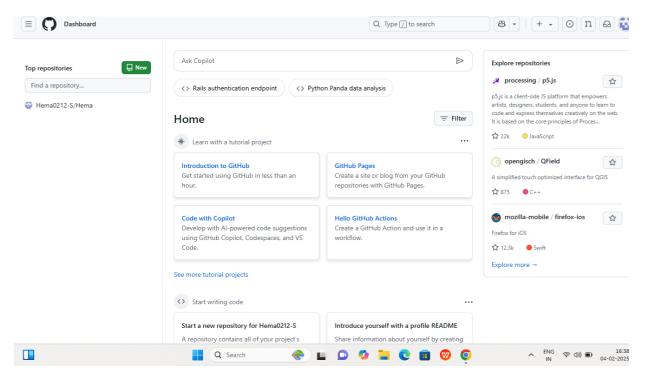

#### Step 1:

#### **Create a New Repository:**

Once you're logged in, click the green "New" button on the topright of your GitHub homepage to create a new repository.

Give your repository a name, for example, my-static-website.

Leave the other settings as default, and click "Create repository".

# Step 2:

Create a folder (e.g., my-static-website) where you'll keep all your website files.

Inside that folder, create the main file for your website, called **index.html**.

Here's a simple example of what to put in your index.html:

```
index
ile
   Edit
      View
<!DOCTYPE html>
<html>
<head>
    <title>My Static Website</title>
</head>
<body>
    <h1>Welcome to My Website</h1>
    This is a simple static website.
</body>
</html>
```

## Step 3:

Open **Command Prompt** and navigate to the folder where your index.html file is saved.

Use the cd command to navigate.

C:\Users\sppra>cd C:\Users\sppra\Desktop\my-static-website

#### Step 4:

Initialize a Git repository by running:

```
C:\Users\sppra\Desktop\my-static-website>git init
Initialized empty Git repository in C:/Users/sppra/Desktop/my-static-website/.git/
```

# Step 5:

Add your website files to the repository:
C:\Users\sppra\Desktop\my-static-website>git add .

#### Step 6:

Save the changes in Git with a commit message:

```
C:\Users\sppra\Desktop\my-static-website>git commit -m "Initial commit"
[master (root-commit) c4d2c7d] Initial commit
1 file changed, 10 insertions(+)
create mode 100644 index.html
```

### Step 7:

Go to your GitHub repository (the one you created earlier).

Copy the **repository URL**:

In your Command Prompt, link your local repository to the GitHub repository:

 $\verb|C:\Users\sppra|Desktop\my-static-website>git remote add origin https://github.com/Hema0212-S/my-static-website.git remote add origin https://github.com$ 

### Step 8:

Push your files to GitHub:

```
C:\Users\sppra\Desktop\my-static-website>git branch -M main

C:\Users\sppra\Desktop\my-static-website>git push -u origin main

Enumerating objects: 3, done.

Counting objects: 100% (3/3), done.

Delta compression using up to 4 threads

Compressing objects: 100% (2/2), done.

Writing objects: 100% (3/3), 341 bytes | 85.00 KiB/s, done.

Total 3 (delta 0), reused 0 (delta 0), pack-reused 0 (from 0)

To https://github.com/Hema0212-S/my-static-website.git

* [new branch] main -> main

branch 'main' set up to track 'origin/main'.
```

## Step 9:

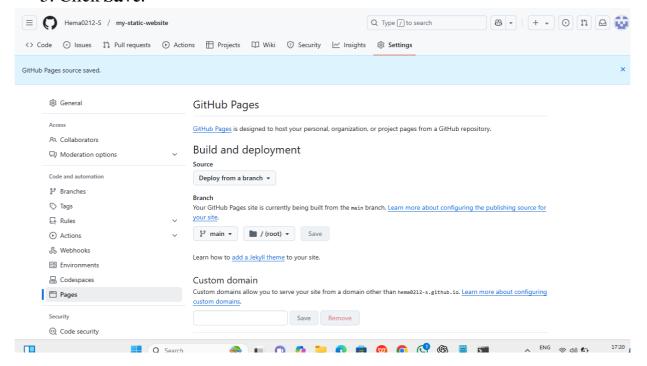

#### **Enable GitHub Pages**

- 1. Go to your repository on GitHub.
- 2. Click on the **Settings** tab (it's near the top, next to Code, Issues, etc.).
- 3. Scroll down to the **Pages** section (on the left menu, under "Code and automation").

#### 4. Under **Source**, select:

Branch: mainFolder: / (root)

#### 5. Click Save.

# Step 10:

#### **Access Your Website**

Wait a few minutes for GitHub Pages to deploy your site.

Visit your website at:

https://<your-username>.github.io/<your-repository>

#### Welcome to My Website

This is a simple static website.

#### Outcome

By completing this PoC of deploying a static website using GitHub Pages, you will:

- 1. Successfully create and configure a GitHub repository for your project.
- 2. Initialize a Git repository in your local project folder and link it to GitHub.
- 3. Upload your static website files (HTML, CSS, JavaScript) to GitHub.
- 4. Enable GitHub Pages in the repository settings to host your static website.
- 5. Access your static website live on the web via a GitHub Pages URL.
- 6. Gain hands-on experience with Git commands like git init, git add, git commit, git remote add, and git push.
- 7. Understand the process of hosting a static site for free using GitHub Pages.
